Water scarcity is especially critical in regions where water is shared by several riparian states and used for competing purposes (irrigation, domestic, industry, environment, and hydropower). There is evidence that water scarcity may give rise to conflicts among the riparian states that share water basins. At the same time, there is evidence that proper arrangements among riparian states create a basis for cooperation, which is a necessary condition for economic development, food production, environmental sustainability, and poverty reduction. This book presents a collection of work presented by a group of academics and policy experts dealing with the impact of water scarcity and variability on the ability to jointly manage shared water and the derived welfare of international states and nations sharing international river basins, consisting of economics, technology, law and institutions, geography, and international relations. The book covers theoretical aspects of management of transboundary water as well as case studies from hotspots around the world. The unique aspect of this book is the multidisciplinary nature of the chapters, reflecting a new field of research that will gain popularity as water scarcity will increase over time and across regions. The chapters from the book were presented at the "Management of Transboundary Water Resources under Scarcity: Perspectives on Agriculture and Food Security" workshop held at The Hebrew University of Jerusalem, Israel, from June 22 to 23, 2015. **Multidisciplinary Management of Prostate Cancer The Role of the Prostate Cancer Unit Springer Science & Business Media** Prostate cancer is the most common neoplasm in men and its management is very complex, in terms of both diagnosis and treatment. Most clinical publications focus on a specific pathology such as "Imaging and/or management of ovarian cancer," but in clinical practice, patients do not present with a diagnosis. Physicians are presented with clinical symptoms, and appropriate use of imaging after a clinical assessment is critical from the point of view of effective intervention to treat a patient. CMS now mandates a clinical decision support system to justify imaging. This is based on making use of appropriate modalities for specific clinical problems that are deemed so by professional society guidelines. In an era of emphasis on cost effective, high quality health care delivery, it is critical for clinicians in training and practice to have a resource that outlines scientifically sound and professional society endorsed criteria for appropriate work up of patients' symptoms. This book applies this symptom-based approach to women's health. Authors are focused on providing a scientifically proven resource to gynecologists, obstetricians, radiologists and internists involved in the management of common symptoms affecting women. Each chapter is based on a common breast or gynecological problem and how patients are triaged for imaging. The implications of the findings and the most appropriate management of the patient are also presented. The text focuses on providing the most effective methods currently available to investigate commonly encountered symptoms in women's health. In addition, there are chapters that outline rationale of screening for breast cancer in women with an average risk and those with an elevated risk for breast cancer as well as a clinician guide to understanding multidisciplinary approach to the Breast cancer patient. This is an ideal guide for gynecologists, obstetricians, radiologists, and internists working in women's health. *Handbook of Research on Multidisciplinary Approaches to Entrepreneurship, Innovation, and ICTs* IGI Global Currently, most organizations are dependent on IS/ICT in order to support their business strategies.
